Project Report: Smart Sorting Transfer Learning for Identifying Rotten Fruits and Vegetables

---

1. INTRODUCTION

Project Title:

Smart Sorting Transfer Learning for Identifying Rotten Fruits and Vegetables
Team Members:

Team Leader : K.Sahithi

Team member: Shaik Narasapuram riyaz

Team member: Sai Lokesh

Team member: Kaveti Sai Ram

---

2. PROJECT OVERVIEW Purpose:

This project aims to reduce food waste and improve quality assurance in agricultural supply chains by using AI to automatically detect rotten fruits and vegetables.

Features:

Image upload feature

AI model for freshness classification

Web-based user interface

Real-time prediction and result display

---

3. ARCHITECTURE Frontend:

Developed using HTML, CSS, and JavaScript (served from static folder) for a responsive UI. HTML templates are stored in the templates folder and rendered using Flask.

Backend:
Built with Python using Flask. Handles routing, model inference, and image processing. Core logic resides in app.py, and the CNN model logic is encapsulated in cnn.py.

Database:

Currently, no persistent database is used. Optionally, a lightweight database like SQLite or MongoDB can be integrated for logging predictions.

---

4. SETUP INSTRUCTIONS

Prerequisites:

Python 3.x

Flask

TensorFlow/Keras

Installation:

Clone the repository: git clone https://github.com/your-repo.git

Navigate to the project directory: cd your-repo

Install dependencies: pip install -r requirements.txt

Place your model file as model.h5 in the project root

Ensure folders media, static, and templates are properly populated

Run the app: python app.py

---

5. FOLDER STRUCTURE

media/ – contains uploaded images static/ –

contains CSS and JavaScript files templates/ –

contains HTML files rendered by Flask app.py –

main Flask application file

cnn.py – defines the model loading and prediction logic

model.h5 – pre-trained CNN model

---

6. RUNNING THE APPLICATION

Flask Backend (also serves frontend):
Run the following command:

```
python app.py
```

Navigate to http://127.0.0.1:5000 in your browser to use the app.

---

7. API DOCUMENTATION

POST /predict

Response:

```
{
  "status": "success",
  "prediction": "Fresh"
}
```

---

8. AUTHENTICATION

Currently, this project does not use authentication. It is planned as a future enhancement.

---

9. USER INTERFACE Upload Image Page

Prediction Result Display

It should be and image with a bar to select images once you selectd an another press predict and you will see results

---

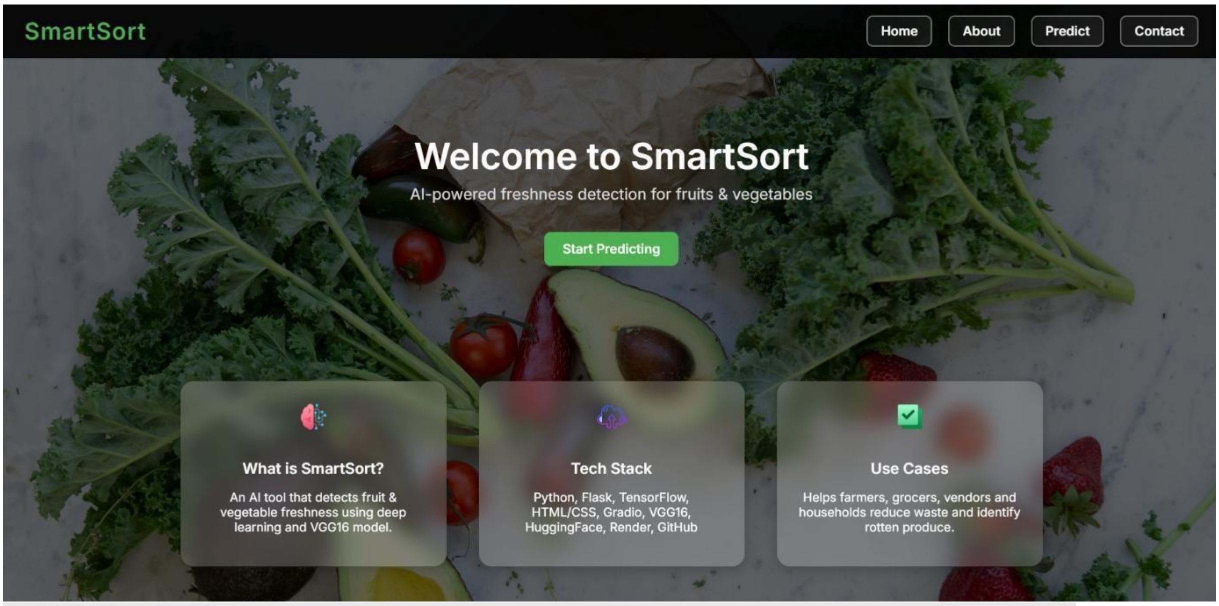
10. TESTING Strategy:

Manual testing of UI interactions

Unit testing using unittest for model functions
Accuracy testing using test datasets

---

11. SCREENSHOTS OR DEMO



Welcome to SmartSort

AI-powered freshness detection for fruits & vegetables

What is SmartSort?
An AI tool that detects fruit & vegetable freshness using deep learning and VGG16 model.

Tech Stack
Python, Flask, TensorFlow, HTML/CSS, Gradio, VGG16, HuggingFace, Render, GitHub

Use Cases
Helps farmers, grocers, vendors and households reduce waste and identify rotten produce.

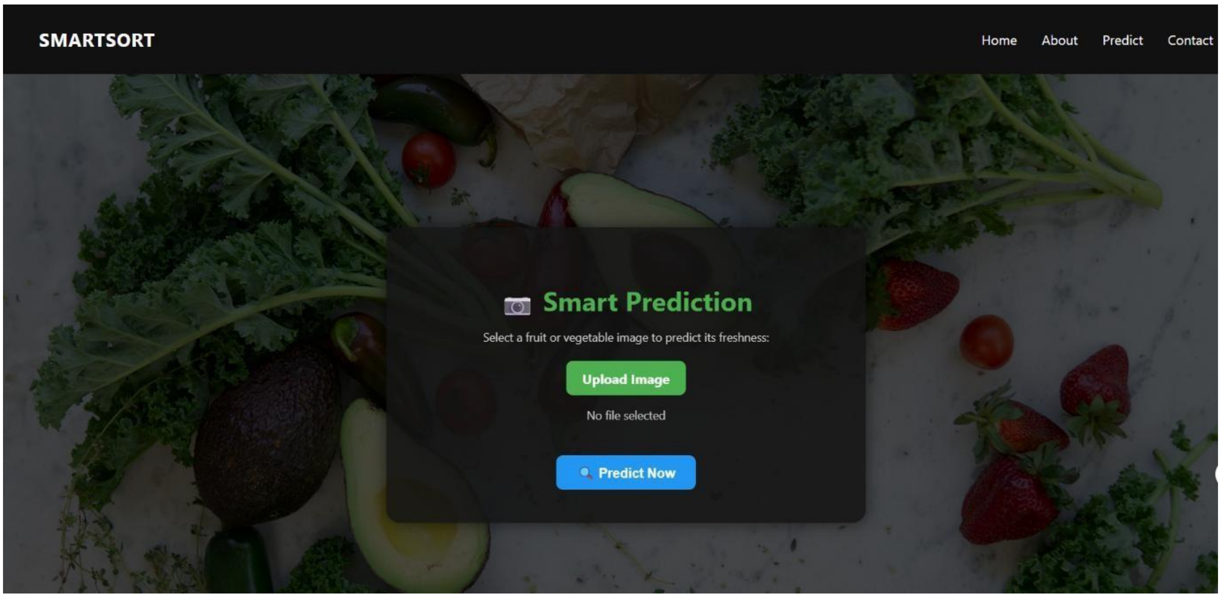
About SmartSort

SmartSort is an AI-powered web application that classifies fruits and vegetables as **fresh or rotten** using deep learning and computer vision.

It is designed to help farmers, food vendors, supermarkets, and consumers quickly assess produce quality and minimize food waste.

With a user-friendly interface and instant image prediction, SmartSort brings the power of machine learning directly to your browser.

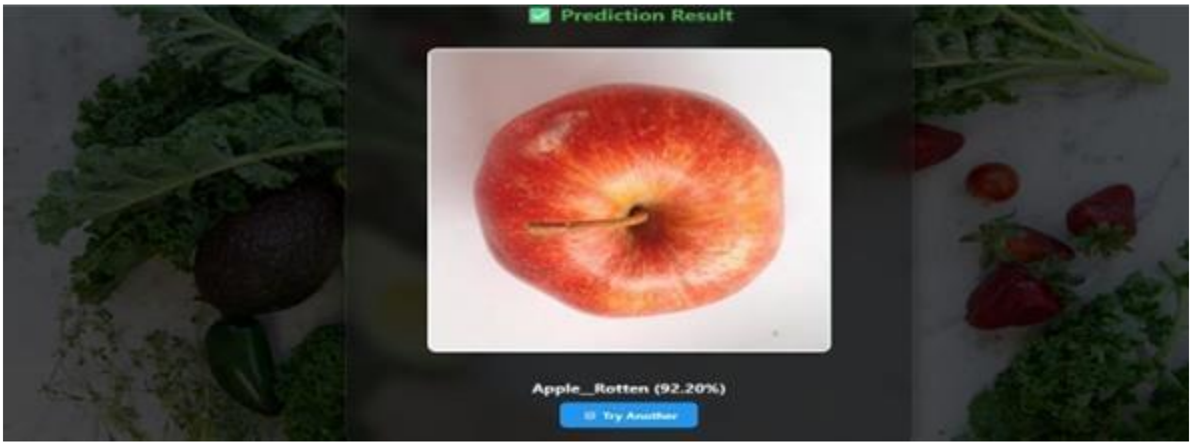
🔧 Tech Stack



📷 Smart Prediction

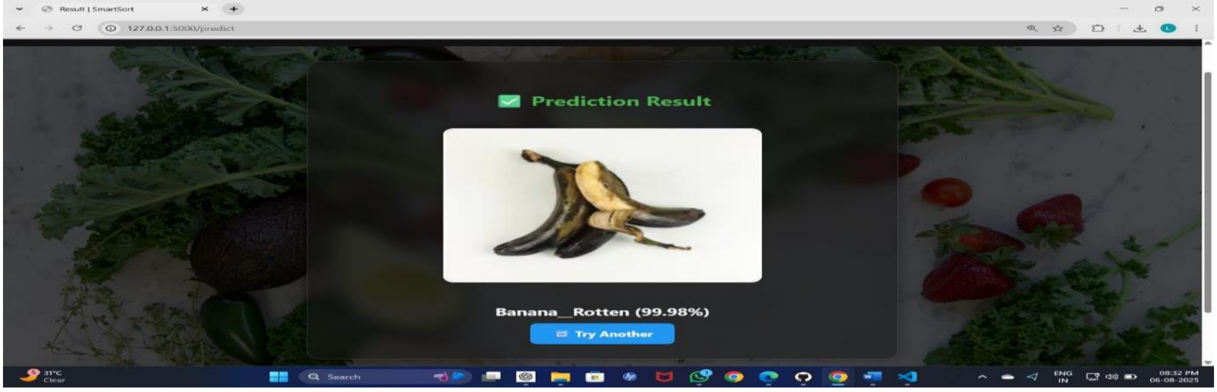
Select a fruit or vegetable image to predict its freshness:

No file selected



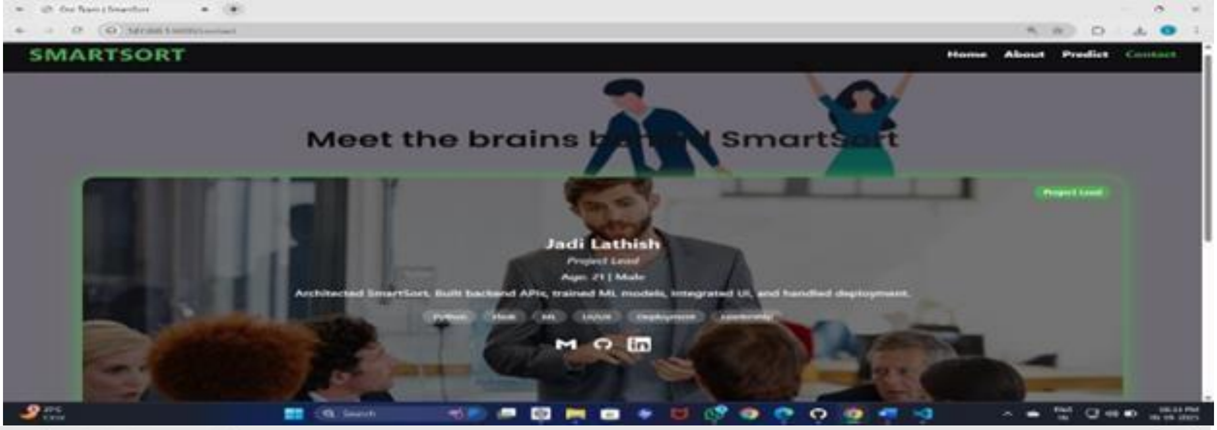
✅ Prediction Result

Apple__Rotten (92.20%)



Prediction Result

Banana__Rotten (99.98%)



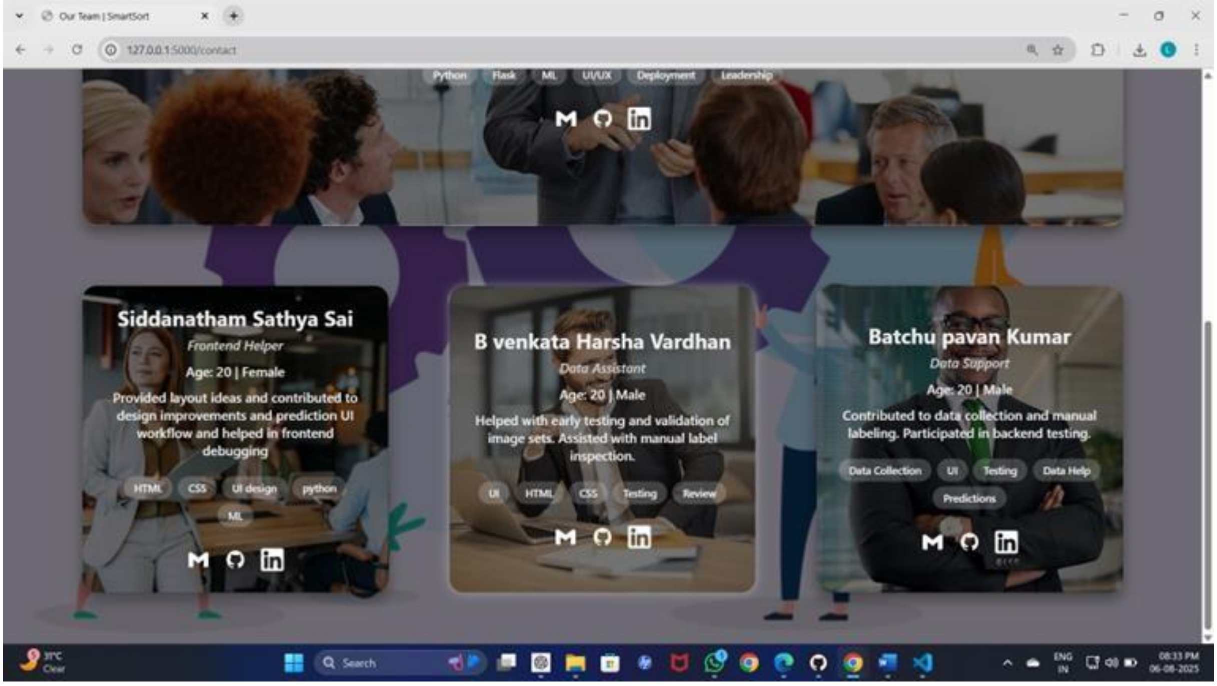
Meet the brains behind SmartSort

Jadi Lathish

Project Lead

Age: 21 | Male

Architected SmartSort, Built backend APIs, trained ML models, integrated UI, and handled deployment.



Siddanatham Sathya Sai

Frontend Helper

Age: 20 | Female

Provided layout ideas and contributed to design improvements and prediction UI workflow and helped in frontend debugging

B venkata Harsha Vardhan

Data Assistant

Age: 20 | Male

Helped with early testing and validation of image sets. Assisted with manual label inspection.

Batchu pavan Kumar

Data Support

Age: 20 | Male

Contributed to data collection and manual labeling. Participated in backend testing.

12. KNOWN ISSUES

- Image quality affects prediction accuracy
- Limited to trained categories (only trained fruits/vegetables) No user login system yet

---

13. FUTURE ENHANCEMENTS

- Add user authentication system
- Enable drag-and-drop upload
- Train model on more fruits/vegetables Develop mobile app version

---
